Turning principles into evidence through institutional AI governance

Joe Sabado

Dec 26, 2025

AI is already influencing teaching, learning, research, and operations across higher education. The question now is how institutions will be asked to account for that influence.

Across higher education, there is broad agreement on at least one point. AI is an impactful technology, and it is not going away anytime soon.

Where disagreement remains is not on relevance, but on **degree and nature of impact**. How deeply AI will affect institutional quality. Where it strengthens effectiveness. Where it introduces new academic, ethical, legal, or reputational risk. And who is ultimately responsible for answering those questions.

Because AI is already reshaping core academic and operational functions, I strongly predict that accreditation agencies will soon begin asking campuses for **evidence, not intent**, about how institutional quality and accountability are being maintained in this environment. This prediction is grounded in informal analysis of signals, guidance, and review patterns across the major U.S. higher education accreditation agencies.

The question will not be whether campuses are experimenting.
It will not be whether a task force exists.
It will be how institutions are governing change and demonstrating impact.

That shift is inevitable.

Why campuses must prepare now

This article explains why accreditation pressure around AI is inevitable, how accreditors already evaluate institutional quality, and why campuses need a holistic framework, a structured decision compass, measurable evidence, and a foundation governance system to be ready.

Accreditors already evaluate quality, academic integrity, student learning outcomes, equity, governance, data integrity, legal compliance, and continuous improvement. Powerful new technologies inevitably intersect with every one of these domains.

As institutional practices evolve, accreditation reviews do what they have always done. They apply long-standing expectations to new forms of delivery, new tools, and new risks. Reviewers do not wait for technology-specific standards to ask substantive questions. They use the standards they already have.

Waiting for a formal “AI standard” misunderstands how accreditation works. Campuses that prepare only when standards are rewritten will already be behind.

The preparation required is not tactical.
It is structural.

What accreditation agencies are

Accreditation agencies are independent bodies recognized by the U.S. Department of Education and the higher education community to evaluate institutional and program quality. They serve as the primary quality assurance mechanism for higher education.

Accreditation determines access to federal financial aid, validates degree credibility, and protects students and the public interest. Accreditors do not approve innovation for its own sake. They assess whether institutions operate with integrity, deliver quality education,

protect students, and continuously improve.

Their role is not optional. Their judgments carry regulatory, financial, and reputational consequences.

The major U.S. higher education accreditation agencies

INSTITUTIONAL ACCREDITORS
These accredit the entire college or university and are the primary gatekeepers for federal financial aid.

- Middle States Commission on Higher Education
- Higher Learning Commission
- WASC Senior College and University Commission
- Southern Association of Colleges and Schools Commission on Colleges
- Northwest Commission on Colleges and Universities
- New England Commission of Higher Education
- Accrediting Commission for Community and Junior Colleges

NATIONAL INSTITUTIONAL ACCREDITORS

- Distance Education Accrediting Commission
- Accrediting Commission of Career Schools and Colleges
- Council on Occupational Education
- Transnational Association of Christian Colleges and Schools

MAJOR PROGRAMMATIC ACCREDITORS

BUSINESS
- Association to Advance Collegiate Schools of Business

ENGINEERING, COMPUTING, AND TECHNOLOGY
- ABET

EDUCATION AND TEACHER PREPARATION
- Council for the Accreditation of Educator Preparation

MEDICINE AND HEALTH
- Liaison Committee on Medical Education
- Commission on Collegiate Nursing Education
- Accreditation Council for Education in Nutrition and Dietetics
- Commission on Accreditation of Allied Health Education Programs

LAW
• American Bar Association Section of Legal Education

What accreditors consistently look for

Across regional, national, and programmatic reviews, accreditors evaluate a stable and well-established set of core elements. These elements define quality, accountability, and trust in higher education. They have remained remarkably consistent over time, even as delivery models, technologies, and institutional structures evolve.

Accreditors examine **mission alignment**. Institutions must demonstrate that programs, initiatives, and investments clearly advance their stated mission and public purpose. Decisions must be intentional and justified.

Accreditors assess **student learning outcomes**. Institutions must clearly define what students are expected to learn and provide evidence that learning occurs. Methods may change, but expectations for learning do not.

Accreditors evaluate **assessment and improvement**. Institutions must measure performance, analyze results, act on findings, and demonstrate improvement over time. Evidence must show that data informs decisions.

Accreditors review **academic quality and rigor**. Curriculum, instructional practices, and credentials must meet appropriate standards across all modalities and delivery approaches.

Accreditors examine **faculty qualifications and governance**. Faculty must be appropriately qualified and must retain authority over curriculum, assessment, and academic standards.

Accreditors assess **academic integrity**. Institutions must protect the validity of student work and credentials and maintain trust in academic outcomes.

Accreditors evaluate **student success and equity**. Institutions must monitor retention, completion, and outcomes across student populations and take action to address equity gaps.

Accreditors review **governance and leadership**. Decision-making structures must be clear, ethical, and accountable. Institutional leaders and governing boards are responsible for oversight and risk management.

Accreditors assess **planning and institutional effectiveness**. Institutions must demonstrate intentional planning, alignment of initiatives with institutional priorities, and evidence that resources are used to advance stated goals.

Accreditors examine **resources and financial stability**. Institutions must show they have sufficient financial, human, and operational capacity to support quality and sustainability.

Accreditors verify **data quality and evidence**. Claims made in self-studies and reports must be supported by accurate, verifiable, and consistent data.

Accreditors ensure **legal and regulatory compliance**. Institutions must comply with privacy, accessibility, civil rights, and consumer protection requirements.

Finally, accreditors expect a **culture of continuous improvement**. Quality assurance is ongoing, not episodic.

New technologies do not sit outside these expectations.
They are evaluated through every one of them.

Why a holistic framework is required

This is where many campuses will struggle.

Most institutions are responding to change in fragments. A policy here. A pilot there. A committee somewhere else. Each effort makes sense alone. Together, they create gaps, inconsistencies, and unanswerable questions.

Accreditors do not evaluate isolated initiatives. They evaluate systems. Fragmented responses produce fragmented evidence. Fragmented evidence does not survive accreditation scrutiny.

A holistic framework changes this.

The intent of the Campus AI Framework

The Campus AI Framework is designed to treat major technological change as an **institutional capability**, not a collection of tools or experiments.

Its intent is threefold.

First, it ensures change advances institutional mission and public purpose rather than undermining them.

Second, it embeds ethical, responsible, and trustworthy practices into routine institutional decision-making, not just aspirational statements.

Third, it produces durable, reviewable evidence. The framework generates traceable decisions, documented oversight, and repeatable processes.

The framework translates responsibility into structure.

You can view the full Campus AI Framework here.

The components of the Campus AI Framework

Mission and vision
All initiatives must support student success, academic excellence, or public service.

Principles
Shared commitments guide decisions across domains. These include transparency, fairness, accountability, human oversight, and respect for human dignity.

Policies and guidelines
Clear rules define acceptable and unacceptable use across teaching, assessment, research, and administration.

Governance, risk, and compliance
Decision authority, risk evaluation, and legal obligations are explicit.

Engagement and collaboration
Faculty, staff, students, and leaders participate through shared governance.

Campus readiness
Skills, infrastructure, data maturity, and culture are assessed before scaling.

Roles and responsibilities
Ownership is clear for initiatives, decisions, and outcomes.

Implementation and operations
Use is monitored, evaluated, adjusted, and improved over time.

The Strategic AI Compass

The Campus AI Framework is activated through the **Strategic AI Compass**, the decision-making engine that governs how AI initiatives move from idea to institutional reality.

The Compass ensures that decisions are **consistent, explainable, evidence-based, and reviewable** before implementation, and validated after implementation.

It operates through a six-stage lifecycle.

Screen
Initial relevance, scope, and institutional fit check.

Score
Initiatives are evaluated using structured **selection rubrics** across five dimensions:

• **Strategic fit**
Alignment to institutional mission, priorities, and accreditation-relevant goals.

• **Ethics and compliance**
Privacy, equity, accessibility, academic integrity, and regulatory alignment.

• **Financial viability**
Total cost, sustainability, opportunity cost, and long-term resourcing.

• **Operational feasibility**
Data readiness, integration complexity, staffing, and change impact.

• **Stakeholder impact**
Impact on students, faculty, staff, and public trust.

Each dimension is scored using defined criteria and weights, making trade-offs explicit rather than implicit.

Select
Leadership makes explicit decisions to approve, defer, condition, or reject initiatives based on rubric results.

Plan
Approved initiatives move into structured implementation with defined owners, controls, and success measures.

Track
Performance, risk, and outcomes are monitored over time.

Reflect
Outcomes are reviewed to validate impact, surface lessons, and inform future decisions.

Together, the Compass creates a closed learning loop aligned to accreditation expectations for assessment, effectiveness, and continuous improvement.

How impact is measured. Evidence, not intent

Because the impact is significant, accreditors will not accept narratives alone. They will expect institutions to show **measures**.

The Campus AI Framework and Strategic AI Compass define three outcome-focused metric categories and two institutional capacity measures.

Key performance indicators
Operational outputs and execution.

Outcomes
Educational, operational, and equity results.

Efficacy
Accuracy, reliability, bias mitigation, and alignment with human judgment.

Readiness assessments
Institutional capacity before and during adoption.

Maturity assessments
Depth of integration, consistency, and sustainability over time.

Together, these measures connect activity to impact and capacity to responsibility.

Why intent is not evidence

Values statements matter. They are not enough.

Accreditors will ask for evidence of quality, integrity, equity, governance, and outcomes. Institutions must be able to show what exists, why decisions were made, who made them, what risks were considered, and what impact is being achieved.

That requires integration, not aspiration.

Why an AI governance system becomes unavoidable

A framework defines principles and expectations.
A compass defines how decisions should be made.
Neither is sufficient without a system to apply them consistently.

In higher education, authority is distributed by design. Academic units innovate. IT enables. Legal advises. Committees review. Leaders oversee. This structure works when activity is limited and slow moving. It breaks down when use accelerates and crosses boundaries.

AI has crossed that threshold.

AI use now spans teaching, research, student services, analytics, procurement, and administration. Decisions occur at multiple levels, using different criteria, on different timelines. Documentation lives in emails, shared drives, and meeting notes. Over time, institutional memory fragments.

Accreditation makes this visible.

When accreditors ask how an institution governs risk, ensures quality, or evaluates impact, they are not asking for policy language. They are asking for evidence of **consistent, repeatable, institution-wide decision making**.

Without an AI governance system:

• AI use cannot be fully inventoried
• Decisions cannot be traced or reconstructed
• Risk reviews occur after deployment
• Oversight is episodic rather than continuous
• Leaders lack a portfolio view of AI activity

At that point, governance becomes reactive. Not because institutions lack values, but because they lack infrastructure.

An **AI governance system** is the infrastructure that operationalizes the Campus AI Framework and the Strategic AI Compass. It turns principles into workflows, decisions into records, and oversight into an ongoing process.

This is the same inflection point that led institutions to adopt systems for finance, research compliance, IRB, data governance, and enterprise risk management. AI has reached that point.

To meet accreditation expectations, institutions need more than shared intent. They need a **system that consistently applies governance, captures evidence, monitors outcomes, and demonstrates control under scrutiny**.

The role of a foundation governance system

A foundation governance system is what makes the framework and the compass real.

Context and concept

AI use across campuses grows faster than institutional control. Decisions happen in silos. Records live in emails and spreadsheets. Leaders often lack clear answers to basic questions. What exists. Who approved it. What risks were assessed. What evidence supports those decisions.

This governance system exists to make AI governance visible, structured, and understandable at an institutional level.

Here is what such a system could look like in practice.

https://campus-ai-demo-site.lovable.app/

Why it matters

AI introduces academic, legal, ethical, and reputational risk. Without structure, risk appears after deployment. Boards, accreditors, and regulators expect defensible decision-making. Faculty and staff need clarity, not ambiguity.

When governance lacks structure:

- AI spreads without oversight
- Decisions lack traceability
- Risk reviews occur too late
- Leaders lose portfolio visibility
- Trust erodes across shared governance

This system addresses those gaps by treating governance as infrastructure, not policy text.

What the system offers

A shared mental model
A clear, common way to think about governance across academic, IT, legal, and executive roles.

Visibility into decision flow
Intake, evaluation, risk review, decision, and oversight appear as one connected system.

Institutional records, not conversations
Initiatives, decisions, assessments, and evidence persist over time.

Lifecycle control
Governance continues through monitoring, pausing, and retirement.

Portfolio perspective
AI is managed as an institutional portfolio aligned to mission, risk, and value.

What this enables

- Clear accountability for decisions
- Defensible governance under scrutiny
- Faster alignment across stakeholders
- Reduced shadow use
- Sustainable scaling with trust

The bottom line

AI is impactful. It is not going away. The only open question is how well institutions govern it.

Accreditation will not ask whether campuses believe in responsible practice.
It will ask how they demonstrate it.

Institutions that approach this holistically, through an integrated framework, a strategic compass, measurable evidence, and a foundation governance system, will already be prepared.

That is how institutions get ahead of the inevitable.

Informal research notes

This analysis draws on ongoing informal research, document review, and synthesis of accreditation guidance and signals. A working research notebook is available here.
